LEARNING DIARY, FRONT-END

LEARNING DIARY

27.10.2021

Part 1

I checked the general information and understood the focus of the course. I am trying to build the project as good as I can, so it would come in use. First, I did the set up for Visual Studio Code, GIT and node.js. Then I started to watch the Part 1 video. I learned that the folder must be on local computer because I first created the project folder to a path that is synced to OneDrive. Then I couldn't do any commands on terminal before I changed the path. I followed the video carefully and at the end did my first commit to GIT.

Part 2

I followed the video and learned to edit text and how to add a background picture. Had some trouble with the background pic at first, but then found out that a line was missing in my index file. After that fix the pic appeared. Created a new config-file to make main look clearer. Did the second commit to GIT.

29.10.2021

Part 3

I followed the video and learned a bit JavaScript also. I had trouble with the changes displaying in the liveserver. Had to do much googling and checking the comment on YouTube. None of them helped. Then I did GIT add & commit and after that the changes also showed correctly.

10.11.2021

Part 4

Learned to do the menu overlay. First I had trouble again with the changes displaying. I did the same tricks as last time and still didn't work. Then with the help of the TA of the course, I finally got the page to work. I had to run the "npm run sass" again and let it run in

the background. I had done this before, but then I wasn't aware that I have to leave it running.

13.12.2021

Part 5

I learned to use the CSS Grid. I had some trouble also with the small portrait showing up to the menu, but then when I resized it a bit, it worked out well. The grid was nice to do and I did modify it a bit to my own project.

Part 6

Today I did the Flexbox to my contact page. It was pretty easy to do, and I did some modifications and added my LinkedIn as a link there also. I also added the links to the icon on my homepage. After completing the video, I wrote the material to the website.

Part 7

I did the deployment to Github pages. I had used Github desktop before, so I was familiar with it. The pages I hadn't used before. Surprised how smoothly it worked out.
